Can the sun shine in

Overview

The Sun shines by turning hydrogen into helium in its core. This process is called nuclear fusion. Fusion happens when lighter elements are forced together to become heavier elements. The Sun, or any star for that matter, “shines” or “burns” due to a process of thermonuclear fusion, not due to a chemical reaction like the oxygen-driven fires on Earth. Because the Sun is so massive, it has great gravity and so its core is under tremendous levels of pressure and heat. The famous scientist Albert Einstein discovered a. The sun generates about 400 billion billion megawatts of power, and it has done so for five billion years. What energy source is capable of this sort of power?

Remarkably, the engine of the mightiest stars is not something immense, but rather something very small: tiny building blocks of atoms. A. Its journey across the sky leads to natural phenomena such as sunrise and sunset, 3. Environmental factors can intermittently obscure sunlight, and 4. Geographic positioning drastically influences sunlight. The nineteenth-century astronomer John Herschel described eloquently the fundamental role of sunshine in all of human life in his 1833 Treatise on Astronomy: The sun's rays are the ultimate source of almost every motion which takes place on the surface of the earth.

Can the sun shine in

5 Years warranty

Why does the sun shine? Find out. , Space , EarthSky

Through a series of collisions, the intense pressure at the sun's core continually fuses four protons together to form helium. With every fusion, energy is released into the stellar interior.
