Classification of centralized photovoltaic bracket types

Overview

Solar brackets that support photovoltaic modules can be divided into rooftop, ground, and water surface types according to the usage scenarios of the modules; According to whether the component angle can be adjusted during the operation of the power generation system, it can be divided. Solar brackets that support photovoltaic modules can be divided into rooftop, ground, and water surface types according to the usage scenarios of the modules; According to whether the component angle can be adjusted during the operation of the power generation system, it can be divided. The two principal classifications are grid-connected or utility-interactive systems and stand-alone systems. Photovoltaic systems can be designed to provide DC and/or AC power service, can operate interconnected with or independent of the utility grid, and can be connected with other energy sources. Before designing photovoltaic modules, it is necessary to understand the structural classification and selection scheme of solar brackets. The JDSOLAR intelligent photovoltaic power station solution has three significant. PV brackets can be divided into three types: fixed, tilt-adjustable, and auto-tracking type, and its connection method generally has two forms of welding and assembly. Among them, fixed-type bracket includes roof-type bracket, ground type bracket, and water type bracket. Power fluctuation is signed to suit specific requirements.

Classification of centralized photovoltaic bracket types

Photovoltaic bracket types description and comparison

According to the different materials used in the main force-bearing rod of the PV bracket, it can be divided into aluminium alloy bracket, steel bracket and non-metallic bracket
