Common reasons for communication base station battery offline

Overview

From the current usage of base station batteries, the most common issues are rapid capacity loss, short lifespan, and frequent site outages. In terms of equipment protection, the batteries, together with uninterruptible power supplies (UPS) and switch power supply systems, play a vital role in preventing voltage surges, spikes, and transients from the electric grid, effectively protecting communication devices and preventing site. Once these batteries are installed and put into operation in a communication base station, they will not be replaced within a few years. Therefore, it is of great significance to strengthen the maintenance of the battery and improve its use, thereby effectively extending the service life of the. In the communication power supply field, base station interruptions may occur due to sudden natural disasters or unstable power supplies. Has suffered power outages before and not had a problem. These batteries support critical communication infrastructure.

Common reasons for communication base station battery offline

Battery Management Systems for Telecom Base Backup Batteries

These stations depend on backup battery systems to maintain network availability during power disruptions. Backup batteries not only safeguard critical communications infrastructure but ...

Voltage range: 691.2-947.2V

>6000 cycles (100%DOD)

Rated battery capacity: 216KWH (customizable)

EMS communication: 4G/CAN/RS485

Base station communication battery life

Telecom base station backup batteries are essential for ensuring uninterrupted communication by providing reliable, long-lasting power during outages. Critical aspects

The Reason for Shortening the Service Life of Base Station Batteries

From the current use situation of base station batteries, it is common for battery capacity to drop too quickly, with short service life, and frequent drop-out accidents.
