

PIENAAR ENERGY (PTY) LTD

Distribution of new energy charging stations

Overview

Overall, availability of public charging infrastructure has increased since 2014, the earliest year for which comprehensive data are available. 2 Between 2020 and 2023, the number of charging stations more than doubled from 28,851 to 64,641, and the number of individual. Building out a national charging network for plug-in electric vehicles (EVs) is part of broader efforts to mitigate the environmental impact of greenhouse gas emissions (GHGs). A robust charging network provides reliable and accessible charging options for EV drivers across the transportation sector – from light-duty passenger vehicles to micromobility solutions. The U. Department of Energy's Alternative Fueling Station Locator contains information on public and private non-residential alternative fueling stations in the United States and Canada and currently tracks ethanol (E85), biodiesel, renewable diesel, compressed natural gas, electric vehicle (EV). While most of the charging demand is currently met by home charging, publicly accessible chargers are increasingly needed in order to provide the same level of convenience and accessibility as for refuelling conventional vehicles. In dense urban areas, in particular, where access to home charging. A national EV charging infrastructure network will support all Americans and provide additional choices for how people and goods can move across the country. About 80 percent of charging happens at home.
