## Overview

---

Solar panels work by converting the light radiation from the sun to Direct Current (DC) electricity through a reaction inside the silicon layers of the solar panel. The sun's energy is absorbed by PV cells, which creates electrical charges that move in a current. " Because most appliances don't use DC electricity, devices called inverters then convert it to. This represents a significant improvement from early solar technology, making solar installations more cost-effective and space-efficient than ever before. Minimal Maintenance, Maximum Longevity: Solar panels require virtually no maintenance while lasting 25-40 years, with degradation rates of only. Solar technologies convert sunlight into electrical energy either through photovoltaic (PV) panels or through mirrors that concentrate solar radiation. To do this several steps are required, as you can imagine. The first step in the whole cycle is the generation of light. In fact, with the amount of sunlight that hits the Earth in 90 minutes, we could supply the entire world with. A solar array is a group of solar panels (also called modules) installed on your roof.
