

**PIENAAR ENERGY (PTY) LTD**

# **Energy Storage System Product Market Ground Level Requirements**

## Overview

---

An overview of the relevant codes and standards governing the safe deployment of utility-scale battery energy storage systems in the United States. Battery storage is a technology that enables power system operators and utilities to store energy for later use. A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to follow all applicable federal requirements and agency-specific policies and procedures. All procurement must be thoroughly reviewed by agency contracting and legal staff and should be modified to address each agency's unique acquisition process, agency-specific authorities, and project-specific. Bloomberg New Energy Finance projects 2030 lithium ion pack costs at \$62/kWh based on observed prices and an 18% learning rate. [4] Over 40% cost reduction projected for lithium ion systems by 2030. 41 GW by 2030, growing at a CAGR of 11. Growing demand for efficient and competitive energy resources is likely to propel market growth over the coming years.

An economic analysis of energy storage systems should clearly articulate what major components are included in the scope of cost. The schematic below shows the major components of an energy storage system. System components consist of batteries, power conversion system, transformer, switchgear, and monitoring and control.
