

PIENAAR ENERGY (PTY) LTD

Energy conservation netherlands

Overview

The Netherlands aims to achieve net zero carbon emissions by 2050, and numerous measures have been introduced to support achievement of this goal. A competitive auctions process awards subsidies to renewables, hydrogen and carbon capture, based on avoided CO₂ emissions. There's a long way to go before this can happen. An offshore wind roadmap is. The greenhouse gas emissions of the Netherlands are projected to reduce by 45-53% in 2030 compared to 1990, in the baseline projection. As such, the probability of reaching the target of 55% reduction in emissions is less than 5%. It is extremely unlikely that the Netherlands will reach the target. The Environmental Activities Decree (Besluit activiteiten Leefomgeving) and the Environment Buildings Decree (Besluit bouwwerken Leefomgeving) requires business locations in the Netherlands that use 50,000 kWh of electricity or 25,000 m³ of natural gas (or an equivalent) or more per year to take. Final energy consumption in 2023, corrected for temperature variations, was about 38 Mtoe (see Figure 1). The figure shows the energy consumption in 2019 as a reference, the last 'normal' year before the Covid pandemic and the high energy prices due to the war in Ukraine.

Home Energy Storage (Stackble system)

High Efficiency Easy installation Safe and Reliable Perfect Compatibility

Product Introduction

- Scalable from 10 kWh to 50 kWh
- Self-Consumption Optimization
- Integrated with inverter to avoid the compatibility problem
- LFP battery, safest and long cycle life
- Stackble design, effortless installation
- Capable of High-Powered Emergency-Backup and Off-Grid Function

Energy transition

We are committed to a reliable, affordable, and sustainable energy supply for the Netherlands, today and in the future. We are working on the creation of a sustainable energy system that is necessary to achieve the ...
