Exhaust design of generator room

Overview

This article explains the fundamentals of sizing, routing, supporting, and silencing exhaust systems for stationary generator sets in the 10 kVA–2 MVA range. Every litre of diesel fuel releases about 42 MJ of chemical energy. In a typical engine, approximately 33% is rejected. Designing ventilation for a generator or transformer room is one of those things that practically every MEP engineer has to do at some point or another in their careers. The rooms are very hot, and without proper ventilation, internal equipment can fail, overheat, or even create safety hazards. A well-designed generator room supports safe, continuous power delivery under varying conditions.
