

**PIENAAR ENERGY (PTY) LTD**

# **Introduction to Mongolian Monocrystalline Silicon solar Panels**

## Overview

---

Monocrystalline silicon PV offers 22-26% efficiency (vs 15-18% for polycrystalline), 25-year lifespan with <math><0</math>. Its low-light performance generates 10% more power at 200W/m<sup>2</sup> irradiance. 5x energy/m<sup>2</sup> versus thin-film. This type of panel is ideal for maximising energy production in limited spaces, such as residential or urban rooftops. Higher heat tolerance (output). Solar panels are composed of multiple solar cells, typically made from silicon or other semiconductors, which convert energy from sunlight into electric current. This conversion is driven by the photovoltaic effect, in which photons from sunlight excite electrons on the active semiconducting layer. Monocrystalline silicon, as the fundamental material for the solar photovoltaic industry, is primarily produced using the Czochralski (CZ) method. Characterized by its uniform structure and high efficiency, it has become the dominant material in the solar industry.
