Is the power supply cost of mobile base stations high

Overview

A typical 5G base station consumes up to twice or more the power of a 4G base station, writes MTN Consulting Chief Analyst Matt Walker in a new report entitled “ Operators facing power cost crunch. ”. The increasing demand for higher data speeds, lower latency, and increased network capacity necessitates more sophisticated and higher-capacity power supplies capable of supporting the energy requirements of advanced 5G base stations. Furthermore, the trend towards miniaturization and energy. Telcos spend on average 5% to 6% of their operating expenses, excluding depreciation and amortization, on energy costs, according to MTN Consulting. And this is expected to rise with the shift to 5G. Modern FPGAs and processors are built using advanced nanometer processes because they often perform calculations at fast speeds using low voltages (<0. Core energy consumption comes from the main equipment (RRU/BBU), air conditioning, and power supply systems (switching power supplies and batteries).
