

**PIENAAR ENERGY (PTY) LTD**

# **Lithium battery pack charged to percent**

## Overview

---

Lithium-ion batteries should not be charged to 100%. Full discharges are unnecessary. Regular partial charges help optimize energy capacity and maintain battery safety while. Charging a lithium battery to 100% isn't always harmful—but it can impact lifespan. Keeping a lithium battery healthy isn't just about using the right battery charger—it's also about understanding how state of. Quick Answer: Battery percentage shows how much charge is left (0-100%), voltage measures the electrical potential (e. 2V per Li-ion cell), and State of Charge (SoC) combines both as the most accurate indicator of remaining energy. By avoiding extreme voltages, you reduce chemical stress inside the cells and significantly extend battery life. To maximize cycle life, system designers enforce cut-off. Why does keeping lithium-ion batteries at a 100% charge damage them?

I have always believed that keeping my laptop or phone plugged in and at full charge would prolong the battery's life, as it minimizes chemical reactions and allows the device to bypass the battery and use electricity directly.

## Why does keeping lithium-ion batteries at a 100% charge damage

By restricting charge to 80% you are more than tripling the cycle life of your battery. A lot of smart devices allow for this restriction these days, somewhere in their battery settings.
