

Microgrids and Fire

Overview

Microgrids are emerging as a potential frontline solution to bolster energy reliability in wildfire-prone regions. These decentralized energy systems operate independently from the main power grid, offering localized sources through renewable energy options like solar and battery. According to preliminary estimates from the California Department of Forestry and Fire Protection (CAL FIRE), the recent Eaton and Palisades wildfires will be the most devastating wildfires in U. history as measured by several criteria (CAL FIRE 2024). Electric utilities face difficult decisions. This blog post explains the crucial need for Community Microgrids in fire-prone regions. This past January, the communities of Altadena and Pacific Palisades in Los Angeles County, CA were devastated by a series of wildfires that destroyed over 18,000 homes and tragically took the lives of at least. But federal tax changes under consideration in Congress could make microgrids more expensive for schools and localities that provide services during emergencies.
