

PIENAAR ENERGY (PTY) LTD

New energy storage participates in frequency modulation

Overview

As renewable energy penetration increases, maintaining grid frequency stability becomes more challenging due to reduced system inertia. This paper proposes an analytical control strategy that enables distributed energy resources (DERs) to provide inertial and primary. To help keep the grid running stable, a primary frequency modulation control model involving multiple types of power electronic power sources is constructed. A reduced. teries for frequency-modulation tasks. The energy storage station has a total rated power of 20-100 MW and a rated capacity of 10MWh-400MWh, meaning 2 y through an electrochemical reaction. Moreover, its power can be adjusted greatly and quickly in a short time, providing fast id frequency.

New energy storage participates in frequency modulation

Optimizing Energy Storage Participation in Primary Frequency

As renewable energy penetration increases, maintaining grid frequency stability becomes more challenging due to reduced system inertia. This paper proposes an analytical control strategy ...
