# **Peak-valley chemical energy storage system configuration**

**200kWh  
Battery Cluster**

## Overview

---

This article proposes an energy storage capacity configuration planning method that considers both peak shaving and emergency frequency regulation scenarios. The economic benefit evaluation of participating in power system auxiliary services has become the focus of attention since the development of grid-connected. This paper presents a solution for energy storage system capacity configuration and renewable energy integration in smart grids using a multi-disciplinary optimization method. The solution involves a hybrid prediction framework based on an improved grey regression neural network (IGRNN), which. New energy storage methods based on electrochemistry can not only participate in peak shaving of the power grid but also provide inertia and emergency power support. A significant contradiction exists between the two goals of minimum cost and minimum load peak-to-valley difference.
