Photovoltaic power storage concept

Overview

Solar energy can be stored primarily in two ways: thermal storage and battery storage. Thermal storage involves capturing and storing the sun's heat, while battery storage involves storing power generated by solar panels in batteries for later use. And it is precisely this ability to "store the sun" that is making storage a valuable ally for those seeking energy. Another method of thermal energy conversion is found in solar ponds, which are bodies of salt water designed to collect and store solar energy. Both are generated through the use of solar panels, which range in size from residential rooftops to 'solar farms' stretching over acres of rural.
