# **Photovoltaic solar panel fire incident**

## Overview

---

In a concerning incident, over 20 solar panels ignited simultaneously on the roof of a residential property, raising alarms about the safety of photovoltaic systems. Data shows that last year, there were six. Basic firefighter strategies and tactics needed to mitigate a residential structure fire have changed with the installation of thousands of solar panel and battery energy storage systems (ESS) in homes across the United States. As such, firefighters need updated training that addresses the presence. While properly installed systems by qualified professionals must follow current safety codes, solar fires do happen. That's why the Solar Energy Technologies Office (SETO) funded the Solar Training and Education for Professionals (STEP) program, which provides tools to more than 10,000 firefighters. Photovoltaic (PV) systems have gained significant popularity as a renewable energy source; however, they are not without their fire risks. In comparison to AC arcing, DC arc faults are more hazardous as the voltage continues to remain once the arcing is established.
