# Photovoltaic support material production

## Overview

---

Producing PV modules and systems requires commodity materials such as glass, steel, concrete, copper, and plastic, as well as specialty materials such as purified silicon, indium, tellurium, or selenium. Solar manufacturing encompasses the production of products and materials across the solar value chain. Those systems are comprised of PV modules. As global solar capacity approaches 1.5 terawatts by 2025, the demand for efficient photovoltaic (PV) support material production equipment has skyrocketed. The evolution of photovoltaic cells is intrinsically linked. Reaching 20 gigawatts (GW) of annual PV sales in the United States by 2050 is a conservative goal. Twenty GW would equate to about 130 square kilometers, or 50 square miles, of PV modules. But will we have enough of the necessary feedstock materials to meet this desired production rate?

Producing. Solar power generation exploits the photovoltaic effect, in which sunlight energy is converted directly into electrical energy by semiconductor devices known as photovoltaic cells. This method, which harvests power from the fully renewable resource of solar energy, promises to slash energy costs.
