Overview

This article investigates current industry practices regarding the wind turbine generator (WTG) waste management, with a focus on blades, which are the most challenging components to manage at the end of their life cycle. Because there are few options for recycling retired wind turbine blades, most end up buried in landfills, like the one shown here in Casper, Wyoming. Credit: Benjamin Rasmussen/Getty Images

Recurring stories and special news packages from C&EN., Fiber-Reinforced Plastics, mostly fiberglass and carbon fiber) and pose a more significant recycling challenge to the wind industry and the composite materials sector. Wind turbines are intricate machines designed to convert the kinetic energy. Wind energy provides a cleaner alternative to fossil fuels, yet it brings its own environmental challenge: the disposal of retired turbine blades. The largest turbine manufacturers in the world are working harder to produce recyclable blades to meet this issue.

Reuse of Broken Wind Turbine Blades

Decommissioned Wind Turbine Blade Management Strategies

Wind turbine blades make up less than 8% of the total wind turbine's mass; however, recycling of blades has proven to be more challenging because of the materials and methods used to make them.
