

PIENAAR ENERGY (PTY) LTD

**Self-built solar power
generation carbon emission
rights**

Overview

Solar PV projects help generate carbon credits while displacing electricity from fossil fuels for lower greenhouse gas emissions. The quantification of such reductions calculates the difference between emissions from conventional energy sources and the zero-emission output of solar. Solar “use” claims and associated claims about greenhouse gas footprint reductions are contingent on the ownership of, or exclusive rights to, the renewable energy certificates (RECs) associated with the solar generator's output. A REC is a tradeable, market-based instrument that represents the. They are key to compliance and voluntary carbon markets so entities can meet emission reduction targets while purchasing credits through verified projects. The effectiveness of carbon credits depends on standards, so reductions are real, additional, and permanent. Many developing countries have. For example, a wind farm that produces a megawatt-hour (MWh) of renewable energy could sell that energy to one party, then sell a REC to another party. Using solar energy can have a positive, indirect effect on the environment when solar energy replaces or reduces the use of other energy sources that have larger effects on the environment.
