# **Solar Photovoltaic Power Generation Answers**

## Overview

---

Solar PV systems generate electricity by absorbing sunlight and using that light energy to create an electrical current. There are many photovoltaic cells within a single solar module, and the current created by all of the cells together adds up to enough electricity to help power. An electrical system consisting of a PV module array and other electrical components needed to convert solar energy into electricity usable by loads. Most electricity is distributed through an electrical utility grid to millions of customers from a relatively small number of large power. Solar energy is a renewable and sustainable form of energy harnessed from the sun's radiation. Below, you can find resources and information on the. Answer: The basic principle of solar photovoltaic power generation is to directly convert solar energy into electrical energy using the photovoltaic effect of solar cells, that is, the photoelectric effect of semiconductors.
