Solar construction of communication base stations

Overview

The communication base station installs solar panels outdoors, and adds MPPT solar controllers and other equipment in the computer room. The power generated by solar energy is used by the DC load of the base station computer room, and the insufficient power is. Deep in the vast desert interior, a solar-powered communication base station operates continuously, delivering stable signals that connect nomadic communities and remote work sites to the outside world— while its fuel bill has permanently dropped to zero. This is not an isolated pilot project. Especially in remote areas or places with unstable mains power, traditional power supply methods often face numerous. This article presents an overview of the state-of-the-art in the design and deployment of solar powered cellular base stations.
