

## PIENAAR ENERGY (PTY) LTD

# The photovoltaic panel has spots

## Overview

---

Hot spots occur when part of a solar panel overheats due to shading (like leaves or dust) or a defective cell, causing concentrated heat that can reach 20-30°C above surrounding areas. This happens because blocked cells resist current flow, forcing electricity to build up as heat. If you see dark spots on your panels, this could be a sign that your panels are undergoing delamination, and you should contact your installer for an inspection. Micro cracks are tiny tears in solar cells stemming from haphazard shipping and installation or defects in manufacturing. Left unchecked. One of the most critical yet often overlooked indicators of panel degradation is the presence of hotspots. It's important to know how hotspots impact system performance and potential reuse, and why anyone involved in solar decommissioning, repowering, or recycling should treat them as a diagnostic. Hot spots can significantly impact the performance and longevity of solar panels, leading to decreased energy production and potential damage to the panels themselves. Understanding the causes and symptoms of hot spots, as well as how to diagnose and address them, is crucial for maintaining optimal. The solar system has a complex structure, with each module comprising intricately engineered and electrically connected solar cells. As a result, the panel gets heated and overloaded, which leads to a short-circuit that lowers output efficiency overall while hastening material deterioration. We have direct experience of.
