

PIENAAR ENERGY (PTY) LTD

The spacecraft is powered by solar energy

Overview

Solar panel equipped, energy transmitting satellites collect high intensity, uninterrupted solar radiation by using giant mirrors to reflect huge amounts of solar rays onto smaller solar collectors. Space-based solar power (SBSP or SSP) is the concept of collecting solar power in outer space with solar power satellites (SPS) and distributing it to Earth. Its advantages include a higher collection of energy due to the lack of reflection and absorption by the atmosphere, the possibility of very. Every hour, more solar energy reaches the Earth than humans use in a year. of this energy is reflected back into space by the atmosphere. Since clouds, atmosphere and nighttime are absent in space, satellite-based solar panels would be able to capture and transmit substantially more energy than. With Artemis IV astronauts set to be the first to call Gateway home, the mission will unlock unprecedented opportunities for science, lunar exploration, and future journeys to Mars. Work is underway to assemble Gateway's Power and Propulsion Element, the module that will provide energy and.
