

PIENAAR ENERGY (PTY) LTD

The use of more natural and renewable energy sources

Overview

Renewables accounted for the largest share of the growth in total energy supply (38%), followed by natural gas (28%), coal (15%), oil (11%) and nuclear (8%). The energy intensity of the global economy improved by a mere 1%, continuing the slowdown seen in recent years. Renewable energy is energy from sources that are naturally replenishing but flow-limited; renewable resources are virtually inexhaustible, but they are limited by the availability of the resources. The major types of renewable energy sources are: Download image U. These primary sources are converted to electricity, a secondary energy source, which flows through power lines and. renewable energy, usable energy derived from replenishable sources such as the Sun (solar energy), wind (wind power), rivers (hydroelectric power), hot springs (geothermal energy), tides (tidal power), and biomass (biofuels).

The use of more natural and renewable energy sources

Renewable energy explained

From the late 1800s until today, fossil fuels--coal, petroleum, and natural gas--have been the primary sources of energy. Hydropower and wood were the most used renewable energy ...
