

Underground energy storage solar energy

Overview

The rapid buildout of wind and solar power generation has set off a race for experimental technologies to capture and store that energy. Several startups in Houston say they've developed ways to cache it underground, and one just announced its first commercial project. The system includes features of compressed-air energy storage (CAES) in that compressed air can be used. Taff, Chief Executive Officer of Sage Geosystems, explains how they use a well to store energy on March 22. The real challenge lies in storing that energy when the sun isn't shining or the wind stops blowing.
