What is a full black component

Overview

Black carbon, commonly known as soot, is a component of fine particulate air pollution (PM_{2.5}). It is formed by incomplete combustion, for example of wood, waste and fossil fuels, a process which also creates carbon dioxide (CO₂), carbon monoxide, and volatile organic compounds., charcoal). What is carbon black?

A vital component in making many of the products we use every day stronger, deeper in color and longer lasting, carbon black in its pure form is a fine black powder, essentially composed of elemental carbon. It is produced by partial burning and pyrolysis of low-value oil. Carbon black (with subtypes acetylene black, channel black, furnace black, lamp black and thermal black) is a material produced by the incomplete combustion of coal tar, vegetable matter, or petroleum products, including fuel oil, fluid catalytic cracking tar, and ethylene cracking in a limited. Blackmagic RAW is just their file format for raw footage from their cameras which contain the most data. It should be harmless but you could delete if if you want. Carbon Black typically contains more than 95 %. Carbon black is mainly used as reinforcing filler in tires and rubber products and also as colorant additive & filler in plastics, inks, coatings and other industrial applications.
