

## **PIENAAR ENERGY (PTY) LTD**

# **What to do if the photovoltaic bracket pull rod is too short**

## Overview

---

If your soil is rocky or you hit bedrock before reaching eight feet, you have two options: angle the rod up to 45 degrees to reach full depth, or install a second rod at least six feet away from the first and bond them together with copper wire. Drive your 8-foot copper-clad steel grounding rod at least eight feet into the earth, or to the depth where you meet solid bedrock. This isn't arbitrary—the National Electrical Code requires this specific length because it ensures your solar panels and battery storage system have a reliable path to ground. It could be something as simple as a minor installation glitch or a more serious problem with the bracket's structure. A lot of the time, problems start during the installation process. If you're having trouble getting the rod to the bottom of any page to find a sun or moon icon to turn dark mode on or off! Oops, great deal on the panels but pigtail leads are too short. As a result the pigtails are too. With solar installations increasing by 18% annually since 2023, the structural integrity of photovoltaic (PV) brackets has become a critical safety concern. Solar panel brackets are an essential component of any solar panel system.

## What to do if the photovoltaic bracket pull rod is too short

---

### What to Consider When Replacing Photovoltaic System Accessories

Mismatched voltages will lead to insufficient charging or overcharging, shortening the battery's lifespan. Additionally, pay attention to the battery capacity (Ah), which needs to be ...
