# **Why Northeast China doesn't use solar power generation**

## Overview

---

China's surge in renewables and whole-economy electrification is rapidly reshaping energy choices for the rest of the world, creating the conditions for a decline in global fossil fuel use. Clean generation growth led by solar and wind met 84% of China's electricity demand. From 2020 to 2024, Heilongjiang increased its share of clean power generation by more than any other province in China except Liaoning, also in the north-east (Image: Xinhua / Alamy) China has been steadily shifting towards a cleaner power mix. The 28% share of non-fossil fuel generation in 2015. While China's deployment of solar panels is highly impressive, its actual generation from these assets is much less so. China is apparently deploying scarce solar assets irrationally, installing substantial numbers of solar panels in several renewables-poor provinces while largely ignoring. In 2024 alone, China installed 360 gigawatts (GW) of wind and solar capacity. 4 terawatts (TW) - that's roughly a third of the entire world's 4. Economic priorities that emphasize industrial production, 2. Substantial reliance on coal as a primary energy source, 3. First, the government should provide adequate policy support and incentives to encourage wind energy development in the Southwestern and Central areas of China and solar energy dev over 5000.

## Why Northeast China doesn't use solar power generation

---

### Why doesn't China popularize solar energy? , NenPower

Certain regions in China have less optimal environments for solar energy capture, making large-scale installations less feasible. For instance, northern provinces might not receive sufficient ...
