ONE-STOP SOLUTION

65kWh 30kW

130kWh 30kW

130kWh 60kW

Overview

(1) This significant reduction has been driven by technological advancements, increased efficiency in production, economies of scale, and greater demand for renewable energy solutions. These storage systems play a crucial role in integrating renewable energy sources like wind and solar. The belief that battery storage systems are prohibitively expensive, making them impractical for widespread use in residential and commercial settings, is outdated. While these systems were once costly, the price of batteries has significantly decreased over the past decade, making energy storage more accessible. Since last summer, lithium battery cell pricing has plummeted by approximately 50%, according to Contemporary Amperex Technology Co. Limited (CATL), the world's largest battery manufacturer. In early summer 2023, publicly available prices ranged from 0.13 USD/Wh, or around the beginning of this year, BloombergNEF (BNEF) released its annual Battery Storage System Cost Survey, which found that global average turnkey energy storage system prices had fallen 40% from 2023 numbers to US\$165/kWh in 2024. Berlin-based scientific think tank Mercator Research Institute on Global Commons and Climate Change (MCC) has released a new study in the journal Energy Research & Social. The price of batteries is one of the biggest factors affecting the growth of electric vehicles (EVs) and energy storage. All-in BESS projects now cost just \$125/kWh as.

Why the price of energy storage system has dropped significantly

Solar power and storage prices have dropped almost 90%

As battery technology has advanced, storage systems' lifespans and energy densities have increased, making them more cost-competitive.
