# Will the wind be too strong for offshore wind power generation

## Overview

---

Can offshore wind costs rapidly return to attractive levels, or is the cost advantage of onshore wind and solar too large, despite offshore wind's favorable production profiles?

In this article, we discuss why the industry has been so hard hit and when it could. Can offshore wind costs rapidly return to attractive levels, or is the cost advantage of onshore wind and solar too large, despite offshore wind's favorable production profiles?

In this article, we discuss why the industry has been so hard hit and when it could. The offshore wind industry is facing macroeconomic pressures that are halting growth and profitability. Developers can embrace four key actions to help navigate this changing environment. Oops, we couldn't find that track. Having proved to be an. The European Union alone increased its target of 300 GW of installed offshore wind capacity to 360 GW by 2050, nearly a tenfold increase from today's installed capacity. More than 66 GW is expected to be tendered globally in 2025, but competitive intensity is weakening. At the request of the Global Offshore Wind Alliance (GOWA), Ember has developed an authoritative and up-to-date overview of offshore wind targets. Our report finds that there is now already 83 GW of offshore wind installed worldwide, keeping the lights on for 73 million households, and powering countries' economic development. According to some estimates, offshore regions of the contiguous United States and Hawaii have the net technical potential to generate more than 13 million gigawatt hours per year. This paper presents an analysis of the area dependency of power and capacity density of wind farms, based on derivations of the available energy in the atmosphere and data on the power production of existing wind farms in the North Sea.
