Wind passes through the pipeline to generate electricity

Overview

Wind turbines use blades to collect the wind's kinetic energy. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. This page offers a text version of the interactive animation: [How a Wind Turbine Works](#). A wind turbine turns wind energy into electricity using the aerodynamic force from the rotor. Wind energy has become one of the most powerful symbols of sustainable progress, capturing nature's invisible force and transforming it into electricity that fuels homes, industries, and cities around the world. Associate Professor of Engineering Systems and Atmospheric Chemistry, Engineering Systems Division and Department of Earth, Atmospheric and Planetary Sciences, Massachusetts Institute of Technology. As renewable energy technology continues to advance and grow in popularity, wind farms like this one have become an increasingly common sight along hills. It's a fairly simple process: When the wind blows, the turbine's blades spin which captures energy.

Wind passes through the pipeline to generate electricity

How is electricity generated using wind?

It's a fairly simple process: When the wind blows, the turbine's blades spin which captures energy. This energy is then sent through a gearbox to a generator, which converts it into electricity for the grid, ...

How does a wind turbine convert wind into energy

Learn how wind turbines transform wind into electricity through steps like capturing wind by blades, rotation and torque production, and the role of generators, detailed in accessible language.
